

JavaScript Timer Challenge: Advanced Pomodoro Dashboard

Build a fully functional Pomodoro Dashboard using only JavaScript timing functions: **setTimeout** and **setInterval**.

Core Requirements

- Create a 25-minute work session timer.
- Create a 5-minute short break timer.
- After every 4 completed work sessions, switch to a 15-minute long break.
- Display the remaining time in mm:ss format.
- Display the current phase: Work, Short Break, or Long Break.
- Add controls for Start, Pause, Resume, and Reset.
- Track and display the number of completed work sessions.
- Flash or visually warn the user during the last 10 seconds of a phase.
- Prevent multiple intervals from running simultaneously.
- Ensure pausing and resuming does not break the timer accuracy.

Advanced Timing Requirement

The timer must remain accurate even if the browser tab freezes, the CPU slows down, or the tab becomes inactive. Do not rely only on decrementing seconds with `setInterval`. Use actual timestamps to calculate remaining time.

Bonus Features

- Automatically start the next phase after a 3-second delay.
- Display status messages between transitions.
- Add sound notifications when a phase ends.
- Create a responsive UI design.
- Store session data using `localStorage`.

Constraints

- Use only vanilla JavaScript.
- Do not use external timer libraries.
- The application must use `setTimeout` and/or `setInterval`.
- Code should be modular and maintainable.

Expected Deliverables

- HTML structure
- CSS styling
- JavaScript functionality
- Accurate timer logic
- Clean user interaction handling
